Big O notation is a mathematical notation that describes the limiting behavior of a function when the argument tends towards a particular value or infinity.

In mathematics and physics, homogenization is a method of studying partial differential equations with rapidly oscillating coefficients, such as $\epsilon \nabla \cdot (\epsilon^{-1} \nabla u) = f$ where ϵ is a very small parameter and $\epsilon^{-1} \nabla$ is a 1-periodic coefficient: $\epsilon^{-1} \nabla + \epsilon^{-1} \nabla = \epsilon^{-1} \nabla$, $\epsilon \in \mathbb{R}$. It turns out that the study of these equations is also of great importance in ...

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

The term "tipping point" commonly refers to a critical threshold at which a tiny perturbation can qualitatively alter the state or development of a system. Here we introduce the term "tipping element" to describe large-scale components of the Earth system that may pass a tipping point. We
